

MOBILE APP SECURITY QUESTIONNAIRE

Project / App Name	RiskRadar
Course / Class	CMPS 490 - Senior Project
Team Members	Team 6
Date	2/20/2026
Instructor	Dr Lipari & Dr. Hsu

Purpose

This questionnaire helps the security analyst on the team understand what the app does, how it is built, and where potential risks might exist. Fill it out as early as possible so security considerations can be addressed during development. If something hasn't been decided yet, write TBD. If a question doesn't apply, write N/A with a brief reason.

1. App Overview

What is the app, who is it for, and what kind of data does it touch?

#	Question	Response
1	What is the app name and a one-sentence description of what it does?	This app provides information about local and global environmental conditions.
2	What platform(s) is it being built for (iOS, Android, cross-platform)?	Cross-Platform? I am unfamiliar and unsure which would be easiest on us.
3	Who are the target users?	This service is for everyday people who wish to be better informed about environmental events.
4	Does the app require user accounts or login?	Yes(?), that or it must be able to use the user's location for local news
5	What types of data will the app collect or store (e.g., names, emails, location, photos)?	Location, Environment Data, Recent Searches (?)

2. Technology Stack

What tools, frameworks, and services make up the app?

#	Question	Response
1	What language and framework are you using (e.g., Swift, Kotlin, React Native, Flutter)?	Apache/MySQL
2	What back-end or server technology are you using, if any (e.g., Firebase, Node.js, Django)?	Apache
3	What database are you using (e.g., Firebase Realtime DB, SQLite, PostgreSQL)?	mySQL

MOBILE APP SECURITY QUESTIONNAIRE

4	List any third-party libraries, SDKs, or APIs your app depends on.	Scraper
5	Where is the back-end hosted (e.g., Firebase, AWS, Heroku, university server)?	Apache(?)

3. Authentication, Data Storage & Secrets

How are users identified, how is data protected, and where do secrets live?

#	Question	Response
1	How do users authenticate (e.g., email/password, Google Sign-In, Firebase Auth)?	Username, Password, and ZIP code
2	Are passwords hashed before storage? If so, what algorithm (e.g., bcrypt, Argon2)?	Passwords will be hashed
3	Is there any role-based access (e.g., admin vs. regular user)?	Regular User and admin(?)
4	Is data transmitted over HTTPS? Are there any plain HTTP endpoints?	Data is stored based on its HTTPS status in the database
5	Is any sensitive data stored locally on the device? If so, is it encrypted?	passwords are hashed (ZIP codes as well???)
6	How are API keys or secrets managed? Are any hardcoded in the app?	Unsure
7	If using a database, who has direct access to it and how is that secured?	Admins will have read/write/execute permissions, while regular users will only read

4. Input Validation & API Security

How does the app handle untrusted input and protect its endpoints?

#	Question	Response
1	How is user input validated (e.g., form fields, search bars, file uploads)?	users will be able to search based on event/caegory
2	Are API endpoints protected against unauthorized access?	Unclear
3	Is there rate limiting on login attempts or API calls?	Unknown
4	If users can upload files or images, are file types and sizes restricted?	No, to my knowledge this is not a platformers that regular users upload to

MOBILE APP SECURITY QUESTIONNAIRE

5 Are error messages generic (not leaking stack traces or database info to the user)?

We plan to implement error messages within the database, unclear as to how specific they will be

5. Privacy & Permissions

What data is collected, what device access is requested, and is the user informed?

#	Question	Response
1	What device permissions does the app request (camera, location, contacts, storage)?	N/S
2	Is each permission necessary for core functionality? Justify any that aren't obvious.	Yes.
3	Is there a privacy policy or data usage notice presented to the user?	ZIP code is requested
4	Is any data shared with third-party services (analytics, ads, crash reporting)?	Uncertain
5	Can users delete their account and associated data?	Unsure, not much data on the user is stored

6. Development Practices

How does the team manage code, dependencies, and security during development?

#	Question	Response
1	Is source code stored in a private repository?	There is no repository outside of the team repo as of now
2	Are there any secrets, API keys, or credentials committed to the repo?	None currently
3	Are dependencies kept up to date? Is there a process to check for known vulnerabilities?	Unsure
4	Does the team conduct code reviews before merging?	Yes, though we have not begun that process yet
5	Is there a plan for what to do if a security bug is discovered after deployment?	Unsure
